

## A NEW FACE OF GEOROIA

## AN ANALYSIS OF THE STATE'S

 POPULATION PROJECTIONS THROUGH 2050This report details anticipated population changes in the coming decades. As Georgia continues to grow, the state will experience shifts toward diversification across all age groups and throughout every county. The diversification of the population will occur while at the same time the senior population will almost double.

## EXECUTIVE SUMMARY

The state of Georgia is projected to have 14.7 million residents by 2050. Georgia's population will continue to grow and diversify over the coming decades. This report examines the state's projected demographic changes through 2050, including the age and racial composition by county.

Georgia has seen a quicker shift toward diversification than the United States as a whole. Georgia will see a "majority minority" population by approximately 2031, when more than half of Georgians are projected to be non-White-13 years before the US population is expected to reach this milestone in 2044.
Demographic changes will be felt across all age groups, races, and counties. Significant population growth will be due to minority youth growth through natural increase (more births than deaths) and continued migration into Georgia from other states.

Overall White population growth will slow but will be supplemented by youth minority populations. Georgia's Black population will continue to increase steadily, while Hispanic, Asian, and other minority groups will grow rapidly.

## REGIONAL DIFFERENCES AND THE AGING POPULATION

Georgia has been growing rapidly in recent years and currently has nine of the fastest growing counties in the United States, but not all regions of the state are experiencing this type of growth. Georgia's changing demographics will impact the state's economy and its communities in different ways.

- Urban centers will continue to see population gains, while many rural counties will continue to see flat to declining populations.
- An additional 5 million people will be living in Georgia by 2050; however, these gains will be highly concentrated in a diversifying metro Atlanta.
- Today, there are 1.2 million residents in Georgia age 65 or older. By 2050, there are projected to be 3.2 million Georgians aged 65 or older.

## INTRODUCTION

Georgia's population is projected to continue to grow and diversify over the next few decades, topping 14.7 million residents by 2050. This report examines where that growth is likely to occur, how the state's population is likely to change, and the implications of these demographic changes through 2050. To put the projections in perspective, children entering pre-K in the fall of 2016 will graduate from high school in 2030, and by 2050 they will be in their 40s.

In the coming decades, Georgia will experience overall statewide population growth, with an anticipated addition of more than 4.7 million residents by 2050, when compared to the 2013 population. These gains will be highly concentrated in the metro Atlanta area, which covers most of North Georgia. The state's overall population growth will primarily stem from two sources: migration into Georgia from other states and increases in the minority youth population through natural increase (births minus deaths).
Overall, White population growth is expected to slow, while the minority youth population is projected to increase substantially.

Georgia's population has been growing rapidly in recent years and currently has nine of the fastest growing counties in the United States. However, some areas of the state are seeing little to no growth. The projected increase in minority residents will help sustain Georgia's growth over the next 30 years, as overall statewide migration patterns and fertility rates have slowed since 2010.

The Black population in Georgia has steadily increased since the 1960s, and Hispanic and Asian populations will continue to experience rapid growth, propelling the state toward increased diversification. Figure 1 shows that this trend is not unique to Georgia, though over the last 50 years, Georgia has seen a quicker shift toward diversification than the United States as a whole. Georgia will see a "majority minority" population by approximately 2031, when more than half of Georgians are projected to be minorities-13 years before the US population is expected to reach this milestone in 2044.

FIGURE 1 White and Minority Population Percentages from 2000 to 2050, Georgia and the United States

Metro Atlanta will experience the largest share of all growth, with six metro counties seeing more than half of the state's growth through 2050. In contrast, 60 Georgia counties will lose population during this time period. Note, however, that over half of the state's 159 counties experienced population losses in the wake of the Great Recession, so the projected population declines are not as drastic as they may seem.

This report highlights residential county population projections through 2050, focusing on the age and racial/ ethnic makeup of Georgia's future population. Demographic changes can affect demand for state resources and infrastructure such as transportation, housing, education, and health care. Neither the concentrated metro population surge nor the growth of youth minority and aging of the White population are unique to Georgia. The state and its growing population continue to lead the South and the nation as an economic hub and cultural pillar.

This report highlights how Georgia's demographic makeup is changing. All data cited in this report, unless otherwise noted, are from the US Census Bureau and the population projections for the state of Georgia published by the Governor's Office of Planning and Budget. Racial/ethnic identity is self-reported in these datasets. For ease of interpretation, race is divided into four categories: White, Black, Hispanic, and a residual "Other" category, which primarily comprises those of Asian descent and people who self-identify as multiracial. Throughout this report, percentages are rounded to the nearest whole number and, thus, may not always total to $100 \%$.

## GEORGIA'S FUTURE GROWTH

Georgia's overall population will continue to increase, but that growth will not be spread equally across the state's populations or geography. The overall state population is projected to increase by $52 \%$ from 2010 to 2050 , with this growth concentrated in the population over the age of 65 and populations under the age of 20 . Metro Atlanta is expected to see substantial population increases, whereas growth in the rest of the state will be proportionally lower. Some parts of Georgia will see little to no growth, and a decline in residents is expected in other areas, such as the southwest corner of the state, where population change has been stagnant or in decline for several years. Georgia's Baby Boomers, of which Whites are the greatest share, are beginning to reach retirement age, causing the portion of the population over the age of 65 to expand significantly. At the same time, the growing younger population under age 20 is mostly minority, signaling a shift in diversification of future growth. Population changes could result in a higher demand on Georgia's current caretaking and public health infrastructure. By 2050, 22\% of the state's residents will be age 65 or older, compared to $13 \%$ in 2016. This gain will more than double the current population of senior Georgians, which could put a strain on both social and economic resources in the future.

To fully understand the projected population changes and how they could affect future state resource utilization, a few population-related terms are helpful.

In-migration refers to people moving to Georgia, typically from other states.
Out-migration is people moving out of Georgia, typically to other states.
Net-migration is the number of in-migrants minus the number of out-migrants.
Natural increase is the number of births minus the number of deaths in Georgia.
The fertility rate is the number of births per 1,000 women aged 15-44 in a calendar year.

In-migration has historically driven Georgia's population growth. By 2010, Georgia's growth from natural increase had surpassed overall growth from net-migration for the first time since the 1960s. However, Figure 2 shows that this shift from migration-driven growth to fertility-driven growth is only temporary. By the 2020s, net-migration will once again overtake natural increase as the primary driver of growth in Georgia, and each future decade will see increasing net-migration and decreasing natural increase. After 2040, the number of deaths will exceed births. Hispanic and Asian fertility rates will continue to drive natural increase, leading to a more racially diverse Georgia.

A cohort-component projection technique was the methodology used to project the resident population by $\mathrm{age} / \mathrm{sex} /$ race for the state of Georgia and its counties. These projections, like all projections, involve the use of certain assumptions about future events that may or may not occur. Users of these projections should be aware that although the projections were prepared using standard methodologies and extensive attempts were made to account for existing demographic patterns, they may not accurately project the future population of the state. The projections are based on historical trends and current estimates. These projections should be used only with full awareness of the inherent limitations of population projections in general and with knowledge of the procedures and assumptions used in their preparation.

## RESIDENT POPULATION

This report covers projections of the total resident population of Georgia's counties from 2013 through 2050. The resident population includes all persons as reported in the 2010 Census Demographic Profile for Georgia and estimates of detailed age-sex-race/ethnicity characteristics of the population. The population is composed of persons for whom Georgia is their "usual place of residence." This includes people in a variety of living quarters such as single-family housing units, multi-unit structures like duplexes and apartment buildings, nursing homes, military barracks, college residence halls, and correctional facilities. Seasonal and temporary residents are not included in the projections.

FIGURE 2 Components of the Change in the Georgia Population, 2015-2040

Outside of metro Atlanta and a few other urban areas in the state, county populations will generally grow slowly or decline. Even though nine of the fastest growing counties in the United States are in Georgia, since 2010 over half of Georgia counties have experienced population loss, and more than $65 \%$ have more people moving out than in. This concentrated growth and loss of in-migration is not unique to Georgia: the United States is seeing a nationwide trend of population declines outside of major metropolitan hubs.

Metro Atlanta and Savannah have seen more than two-thirds of Georgia's population growth since 2010, mostly due to strong growth in the Hispanic and Asian populations as well as steady increases in Georgia's Black population.

Since the 1960s, most of Georgia's population growth has been due to in-migration to the state rather than natural increase, which peaked in the 1990s when over 1 million more people moved in than left the state. The trend then flipped throughout the 2010s, when the state's growth was predicated on natural increase. This reversal is indicative of the
state's diversification: the migrants who came during the boom of the 1990s have raised families and now account for the growing number of minority births and subsequent population gains. Currently, just over half of the population is Georgia-born and more than $12 \%$ of Georgia residents speak a language other than English at home.
This birth-driven growth in minority populations signals that growth is not rooted in in-migration-like the wave of migrants who came to the South since the Civil Rights Movement-but instead is largely due to Georgia-born minorities staying and raising families here, leading to long-term minority population gains in both urban and suburban metro Atlanta. Over the next 30 years, Black, Hispanic, and Asian populations will lead the population growth in suburban Atlanta as White Baby Boomers retire.

Combined with overall slowing in-migration and decreasing fertility rates, the once proportionally smaller Hispanic and Asian populations who moved here during the migration boom have stayed and now are largely driving the state's overall growth, whereas the White population is growing far more slowly. These minority gains are expected to power the state's growth moving forward and will significantly affect Georgia's economic and social structure.

## GEORGIA'S SHIFTING AGE AND RACIAL COMPOSITION

Two demographic factors will drive Georgia's population growth in the coming decades: age and racial diversification. First, the senior population will mushroom in size, as the Baby Boomer generation ages out of the workforce and into retirement. About one in five Georgians will be 65 or over by 2050, more than doubling 2016 levels. Second, Georgia's racial composition is as varied as it has ever been, and it will continue to diversify over the next 30 years.

Both of these changes mean that additional infrastructure will be needed to support these groups. For perspective, currently slightly over 1 million Georgians are over the age of 65 ; by 2050, the state will be home to more than 3 million seniors. Needs such as caregiving and health care services for these 2 million additional seniors are likely to shift resource demand. This group will account for $22 \%$ of Georgia's population, an increase from the current $13 \%$. For further comparison, there will be the same proportion of Georgians over 65 as there will be young Georgians under the age of 20 in 2050.

One way to analyze youth and senior growth is with the dependency ratio, which compares the working-age population to the traditional retirement-age population. Figure 3 shows Georgia's dependency ratios over time from 2010 to 2050, calculated using populations under 20 and over 65 . As the Baby Boomer generation ages into retirement, Georgia's dependency ratio will grow, indicating a larger demand for resources to care for this population. Concurrently, as fertility rates continue to slow, Georgia's youth dependency ratio will shrink slightly. However, because of the dramatic gains in old-age dependency, Georgia will see overall dependency ratios nearing 80 , which have not been experienced since the post-war Baby Boom dramatically increased the ratio in the 1960s.

FIGURE 3 Georgia's Youth and Old-Age Dependency Ratios from 2010 to 2050

By 2031, over half of the state's population will be made up of people from minority groups. This proportion will grow to $56 \%$ of the total population by 2050 and account for 8.2 million Georgians, a more than $72 \%$ increase from the current non-White population. Table 1 shows that this milestone of more minorities than Whites has already been reached among certain age groups, like young Georgians. Currently over half of the people under the age of 20 are minorities. This proportion will only continue to rise: by 2050, $64 \%$ of people between the ages of 0 and 19 will be non-White, or almost two out of every three young people. This growth will constitute a $35 \%$ increase in the minority youth population.

TABLE 1 Tipping Points for Majority-Minority per Age Group in Georgia

| Age Group | Year Becomes "Majority Minority" |
| :--- | ---: |
| Under age 20 | 2007 |
| Age 20-59 | 2024 |
| All ages | 2031 |
| Age 60 and up | Post 2050 |

The state's overall population will grow by $52 \%$ between 2010 and 2050. Figure 4 shows how the racial/ethnic makeup of the Georgia population will change over that time period. The White population will increase at the slowest rate to almost 6.5 million, whereas the Hispanic and Other populations (primarily Asian and multiracial residents) will more than double their current size to almost 3.5 million people. This dramatic growth will result in Hispanic and Other groups equaling $24 \%$ of Georgia's total population and almost half of the state's total minority population. It is important to bear in mind for perspective that the higher percentage growth is from currently smaller populations. Figure 4 shows that a larger White population will grow more slowly, whereas the originally smaller minority proportions will expand rapidly.

FIGURE 4 Georgia's Projected Population Growth by Racial/Ethnic Group, 2010-2050

Georgia's Black population will grow steadily to 4.7 million people by 2050. Although the number of Black residents in Georgia has fluctuated over the years, it has remained significantly higher than that of other states and the United States as whole, and will continue to grow. The US Black population will grow from $12 \%$ to $13 \%$ by 2050. Compare that slight increase to Whites, who currently comprise $62 \%$ of the overall population and will decline to $47 \%$ of the overall US population by 2050. Georgia has a much higher proportion of Black residents, who currently comprise $31 \%$ of the state's total population and are projected to make up $32 \%$ of Georgia residents by 2050. In the context of slowing White population growth and dramatic increases in the growth of Hispanic and other minority groups, a small change in the Black population still represents steady growth in an otherwise slowly growing population. Figure 5 illustrates the projected growth in the number of Hispanic and Black Georgia residents between 2010 and 2050.

FIGURE 5 Georgia's Projected Black and Hispanic Gains Over Time

The aging of the White population and gains in minority populations are not unique to Georgia, as these trends will be seen across the United States. However, Georgia has been and will continue to be a demographically diverse state relative to others. This will be doubly felt within the dichotomy of an older White population and a mostly minority youth population. Fifty-seven percent of Georgians ages 65 and up will be White in 2050, whereas only $36 \%$ of people under age 20 will be White. Georgia is projected to have 100,000 fewer Whites under the age of 20 in 2050 than there are today. As seen in Figure 6, Georgians over the age of 65 will grow from just over 1 million to almost 3.5 million by 2050. The figure shows a similar 2050 population of 3.2 million Georgians under the age of 20, but this is a far less drastic increase than the 65 and up population growth.

As current Millennials continue to age into the workforce, they will be replaced by a diverse wave of minority youth. Furthermore, while minority births will drive the youth growth, Figure 7 shows that the slice of the total population composed of young people under 20 will decrease from $27 \%$ of the population in 2010 to $22 \%$ of the total state population by 2050, signaling slowing natural increase. Figure 7 again illustrates that the minority youth growth is a vital stimulant to what otherwise would be stagnating and aging growth.

FIGURE 6 Georgia's Projected Age Structure, 2010 to 2050

FIGURE 7 Georgia's Current and Projected Race Makeup by Age, 2013 and 2050

## BLACK GAINS AMID PERSISTENT LOSS

Dougherty County, home to Albany and the urban nucleus of the mostly rural southwestern corner of the state, is projected to experience a rare trend of Black population growth in the midst of overall population decline. The share of Black residents is expected to grow from $60 \%$ in 2000 to $82 \%$ by 2050, increasing the county's Black population by $25 \%$. Other minorities will see gains as well, though they will still represent marginal totals. Despite anticipated gains in overall minority populations, the county is projected to lose more than 4,000 residents by 2050, making it one of the five counties in the state that will lose the most residents over the next 30 years. While the overall population of Dougherty has declined steadily since 2000, the Black population will grow by more than 10,000 residents by 2050 and provide a much needed energizer to an otherwise contracting region.

Population of Dougherty County 2010 and 2050

TABLE 2 Generational Cohorts in Georgia and the United States, 2050

| Generational Cohorts, 2050 | Georgia | US |
| :--- | ---: | ---: |
| Total Population | $14,709,321$ | $398,328,000$ |
| Boomers (1946-1964) | $3 \%$ | $5 \%$ |
| Gen Xers (1965-1980) | $13 \%$ | $12 \%$ |
| Millennials (1981-1996) | $19 \%$ | $17 \%$ |

Although Figure 7 clearly shows that those under age 20 will continue to drive the diversification of the state, the age 65 and older population will also become an increasingly diverse group over time. In 2050, more than half of this group will still be composed of White Georgians, but the diversity wave already underway in the state will affect this age group as well. Whereas about a third of Georgians under age 20 will be Black in 2050, $27 \%$ of Georgians age $65+$ will be Black at that time. The most drastic shifts in this older population will occur in Hispanic and Other groups as the Gen Xers follow the Baby Boomers into retirement. As seen in Table 2, Gen Xers will represent over $13 \%$ of Georgia's population by 2050 and will continue to drive racial diversity in the older age groups. By 2050, the share of Georgians age 65 and older who are Hispanic or Other will grow by $558 \%$. By mid-century, $17 \%$ of people 65 and older will be Hispanic or Other, compared to just $5 \%$ in 2013.

## WHERE GEORGIANS WILL LIVE IN 2050

Georgia is known for its abundant farmland, suburban growth, and densely populated and diverse capital. These features will continue to influence the geographic distribution of the state's population over the next 30 years. From 2000 to 2010, 31 of Georgia's 159 counties lost population, as rural southwestern counties and parts of eastern Georgia struggled to maintain growth and middle and coastal counties began to see the population loss effects of the Great Recession. Over the subsequent three years, the Great Recession hit Georgia hard. By 2013, over half of Georgia counties were experiencing shrinking populations, with only the metro Atlanta region wholly immune to the trend. Each corner of the state was affected, some areas more than others. Over the next 30 years, some Georgia counties will begin to recover population, and 60 will experience population loss by 2050. Figure 8 shows the percentage of projected population loss/gain for all 159 Georgia counties between 2010 and 2050.

Three of the five counties projected to experience the greatest numerical population loss-Sumter, Dougherty, and Macon counties-are clustered in the rural southwestern part of the state and have been struggling with population loss for decades. McIntosh County on the coast and Hancock County in central Georgia round out the top five. These five counties combined will lose almost 26,000 people by 2050. Sumter County is expected to sustain the largest loss, over 8,500 residents.

Hancock County, in central Georgia, and Webster County, to the southwest, will see the largest percentage population declines, losing $50 \%$ and $53 \%$ of their residents, respectively.

Metro Atlanta will see over $75 \%$ of the state's growth through 2050, with only two counties on the rural outskirts of the metro area experiencing shrinking populations, Heard and Meriwether. The metro area alone will gain more than 3.5 million residents over the next 30 years. Gwinnett will account for over $15 \%$ of the state's overall population gain. Gwinnett will continue to be one of the most diverse counties in the state, leading the metro area in diversification trends seen across the state. By 2050, $25 \%$ of Gwinnett residents will be Hispanic, $35 \%$ will be Black, $20 \%$ will be White, and $20 \%$ will be another race (primarily Asian or multiracial). By 2050, the county will be home to $21 \%$ of the state's Hispanic population and $20 \%$ of the state's Other residents, primarily people who identify as Asian or multiracial. In 2014 Fulton became the first Georgia county to top more than 1 million residents. Gwinnett will soon follow, reaching this milestone in approximately 2021.

Of the projected increase of 4.7 million Georgia residents by 2050, just six counties will account for over half of that growth. These counties will see the largest numerical growth, two of which-Forsyth and Cherokee-will have over $100 \%$ growth, at least doubling in size by 2050. Gwinnett, Fulton, Forsyth, Cherokee, Cobb, and Henry will add the largest numbers of residents.

FIGURE 8 Percentage Change in Population by County, 2013-2050

Black Georgians will continue to account for the largest share of minorities in Georgia, and this group will continue to steadily grow in metro Atlanta. Whereas not all Georgia counties will see gains in their Black populations, only nine counties will register a loss in Hispanic residents in 2050. These losses are small as the Hispanic population will grow by over $90 \%$.

Table 3 shows the Georgia counties with the largest projected population gains and losses between 2013 and 2050. Like counties across the state, the fastest growing numbers are due to increases in minority populations, the sharpest of which rely on Hispanic and Asian natural growth. Outer suburbs like Cherokee and Forsyth will likely see continued White growth, supplemented by Asian and Hispanic gains.

TABLE 3 Georgia Counties with the Largest Projected Gains and Losses Through 2050

| County | 2013 Population | 2050 Population | Overall Percent <br> Change |
| :--- | ---: | ---: | ---: |
| Forsyth | 195,405 | 597,255 | $206 \%$ |
| Cherokee | 225,106 | 494,713 | $120 \%$ |
| Gwinnett | 859,304 | $1,581,299$ | $84 \%$ |
| Fulton | 984,293 | $1,631,265$ | $66 \%$ |
| Cobb | 717,190 | 984,089 | $37 \%$ |
| Dougherty | 92,969 | 88,575 | $-5 \%$ |
| Sumter | 31,364 | 22,844 | $-27 \%$ |
| McIntosh | 14,007 | 9,958 | $-29 \%$ |
| Macon | 14,009 | 9,686 | $-31 \%$ |
| Hancock | 8,879 | 4,447 | $-50 \%$ |

## GEORGIA'S FUTURE WORKFORCE DEMOGRAPHICS

By 2025 alone, there will be over 1 million Black Georgians in the workforce, those ages 20 to 64, in six of the fastest growing metro counties, accounting for over $40 \%$ of the workforce in Fulton, DeKalb, Gwinnett, Clayton, Henry, and Cobb. Three of these counties-Gwinnett, Henry, and Cobb—will see losses in their White workforce, and all six will see dramatic gains in minority workforce populations, as two out of every five workers will be Black. In the same time span, the Other population of working age (primarily residents who identify as Asian or multiracial) will more than double in Forsyth and grow by $42 \%$ in Gwinnett to almost 100,000 residents. The Hispanic workforce will grow by over one-third in Gwinnett to be the largest in the state at over 140,000. At the same time, Gwinnett's Black workforce population will grow by $50 \%$, reaching almost 200,000 by 2025.

## blue ridge: Aging in place

Fannin County, at the foot of the beautiful Blue Ridge Mountains, is projected to experience minimal growth over the next three decades. This projection runs counter to the growth the county experienced in the late 1990s and early 2000s. Fannin was one of the few counties that did not register population loss immediately after the Great Recession, growing steadily from 2000 to 2010. That growth has since slowed due to an aging population and low in-migration. Between 2028 and 2050, the county's population is projected to decline to just shy of 23,000 as the current residents age and are not replaced by a younger population. As noted earlier, the resident population projections do not account for seasonal or part-time residents. Most of Fannin's population is White, which will hold through the coming decades. In 2016, about a quarter of Fannin's population is over age 65; however, by 2050 , this population will grow to represent slightly more than one in three residents. Despite Fannin's allure as a retirement destination, the projected lack of growth in the county could be a ripple effect of the Great Recession and the significant losses to retirement savings and home equity. As more Baby Boomers age into retirement and represent over 20\% of the state's population, many may choose to live near their children or family members in the metro areas of the state rather than retiring near the mountains.

This diversification of the working-age population will be seen across the state throughout the coming decades but will continue to be most pronounced in the metro area. The workforce is a vital contributor to the state's economy, and these changes in the future workforce have implications for the state's housing and education infrastructure. Georgia's working-age residents will be raising families, contributing most to the economy, and making use of public resources, like schools and public transportation.

The diversification of the state's population will continue through 2050 as young Georgians under age 20, currently the most diverse age group, enter the workforce.

## CONCLUSION

Georgia is a growing and increasingly diverse state. With a projected population of 14.7 million residents by 2050 , the state will face increased demands on its infrastructure and services. Significant growth is projected in the metro Atlanta region, along Georgia's coast, and in the regional metro areas around the state. However, many rural counties will continue to see flat to declining populations. The aging of the Baby Boomers and their children over the next four decades will cause the population over the age of 65 to increase from 1.2 million residents today to 3.2 million by 2050 .

Demographic changes will be felt across all age groups, races, and counties. Significant population growth will be due to minority youth growth through natural increase (more births than deaths) and continued migration into Georgia from other states. Overall, White population growth will slow but will be supplemented by youth minority populations. Georgia's Black population will continue to increase steadily, while Hispanic, Asian, and other minority groups will grow rapidly.

These projections describe a state with a growing senior and youth population that is diversifying across all racial groups. Shifts in population and diversification will impact the state's economy and its communities. These projections provide the foresight to allow the state to prepare to meet the challenges and opportunities ahead.

Population projections provide one lens into the potential future of the state. Economic and social forces are always changing, and new opportunities are likely to emerge that will impact the state's population. These projections, like all projections, involve the use of certain assumptions about future events that may or may not occur. The projections are based on historical trends and current estimates. These projections should be used only with full awareness of the inherent limitations of population projections in general and with knowledge of the procedures and assumptions used in their preparation.

## VINSON INSTITUTE OF GOVERNMENT <br> The University of Georgia

Since 1927, the Carl Vinson Institute of Government has been an integral part of the University of Georgia. A public service and outreach unit of the university, the Institute of Government is the largest and most comprehensive university-based organization serving governments in the United States. Assisting public officials and promoting excellence in government, particularly in Georgia, is the chief objective of the Institute of Government. Through studies relevant to government operations and decision making, training and development, customized assistance, and the application of technology, the Institute has the expertise to help state and local government leaders navigate change and forge strong directions for a better Georgia.
